Peptic ulcer test (H. pylori) - Your result

Name	Your value	Reference value	Scale
Helicobacter AG	negative	negative	

getTested offers a simple test to check for the bacteria *Helicobacter pylori* (H. pylori) in the stomach. H. pylori is a bacterium that can be found in the lining of the stomach. An infection with H. pylori can lead to gastrointestinal problems of varying severity.

However, most people with an H. pylori infection do not experience any symptoms at all. About 1% of those infected develop peptic ulcers, which require medical treatment of the infection.

In the event of a positive result (within the red area), we recommend that you seek medical attention if you have serious symptoms.
